

Here are the latest stats from clinical studies done by Fenestra Research on the “next generation” Basic Stirwand™, completed Spring 2010. The current brochure/website reflects stats from the previous 90 day study completed in 12/2007. The complete study and blood microscopy before and after slides will be published on [www.quantumagewater.info](http://www.quantumagewater.info) soon. You can find the 2007 and previous studies there.

Testing was done utilizing the Basic or 24/7 Stirwand™. The study included 125 people, 100 people drinking half their body weight in ounces of “stirred” purified water daily, and 25 drinking the same amount of non-stirred water.

Blood oxygen level – increase of 13.5% in 2 weeks (average beginning was 86% versus average beginning of 88% in previous clinical trial, ending at 98%+ )

Hydration level – 32.4% in 30 days

Cellular toxin release – 19.4% in 90 days

ATP – 11.3% in 30 days (not tested in previous trial)

Previous clinical trial improvements:

Blood oxygen level – 10.25% (avg beginning was 88%)

Hydration level – 28.5%

Cellular toxin release – 18.2%

Heavy metals tested (not done in any previous clinical trials, Dave expects results would have been very similar based on the cellular toxin release improvement in both studies):

% reduction in 90 days:

mercury – 75%

cadmium – 68.57%

nickel – 57.14

aluminum – 46.66%

lead – 41.57

A few other important notes from the study:

*“Clinical studies are factual presentations about the capacity of any given drinking water to increase cellular hydration.”*

**No significant improvement in hydration, blood oxygen levels or cellular detox rates were noted for the control group, all drinking the same amount of water daily as those in the test group drinking “stirred” water.**

Hence the answer to increasing hydration is not as simple as just drinking more water. Even drinking “enough” water daily, Fenestra finds most people are still dehydrated.

Regarding pH – the wand does not change the pH of the water you drink, but pH is one of the things the wand stabilizes. Part of the study included Fenestra Research’s Optimal Wellness test, which tests pH among a number of other things in analyzing overall wellness. Here is what was reported in the 2010 study: *“The pH indicators provided within the **Optimal Wellness Test** indicate a positive move of up to 27.2% toward neutral pH (7.0) in regards to the wellness parameters of those in the live product (stirred water) group. This shift in pH toward a more neutral cellular chemistry may be due to the aforementioned chemical changes occurring in the reduction of nitrates and toxins. Many studies have shown the importance of maintaining neutral cellular chemistry for increasing one’s ability to experience wellness.”*

Drinking water with a high pH is not the answer to getting to a neutral pH in the body, so that individual organs/bodily functions can function at their optimal pH levels. In fact, consuming high pH water on a regular basis may in fact be detrimental to health. Drinking balanced, stabilized water that hydrates and allows the body to do its job is the answer.

Quantum Age Water knows of no other water product, or water, that has clinical study results that even come close to the effectiveness of the Stirwands™ in getting more water in to the cells. And it’s helped many go from looking at drinking enough water (half your body weight in ounces, daily) as a chore to it being a welcomed habit.
